Biological Science (6th Edition)

Synopsis

NOTE: You are purchasing a standalone product. For introductory courses for biology majors. Uniquely engages biology students in active learning, scientific thinking, and skill development. Scott Freemanâ™s Biological Science is beloved for its Socratic narrative style, its emphasis on experimental evidence, and its dedication to active learning. Science education research indicates that true mastery of content requires a move away from memorization towards active engagement with the material in a focused, personal way. Biological Science is designed to equip students with strategies to assess their level of understanding and identify the types of cognitive skills that need improvement. With the Sixth Edition, content has been streamlined with an emphasis on core concepts and core competencies from the Vision and Change in Undergraduate Biology Education report. The textâ™s unique BioSkills section is now placed after Chapter 1 to help students develop key skills needed to become a scientist, new âœMaking Modelsâ• boxes guide learners in interpreting and creating models, and new âœPut It all Togetherâ• case studies conclude each chapter and help students see connections between chapter content and current, real-world research questions. New, engaging content includes updated coverage of global climate change, advances in genetic editing, and recent insights into the evolution of land plants. If you would like to purchase both the physical text and MyLab & Mastering, search for: 0321993756 / 9780321993755 Biological Science Plus MasteringBiology with eText -- Access Card Package, 6/e Package consists of: 0134261992 / 9780134261997 MasteringBiology with Pearson eText -- ValuePack Access Card -- for Biological Science 0321976495 / 9780321976499 Biological Science

Book Information

Hardcover: 1360 pages

Publisher: Pearson; 6 edition (January 17, 2016)

Language: English

ISBN-10: 0321976495

ISBN-13: 978-0321976499

Product Dimensions: 9.2 x 1.8 x 11 inches

Shipping Weight: 7.3 pounds (View shipping rates and policies)

Average Customer Review: 4.2 out of 5 stars 314 customer reviews

Customer Reviews

Lizabeth A. Allison is Chancellor Professor of Biology at the College of William & Mary. She received her Ph.D. in Zoology from the University of Washington, specializing in molecular and cellular biology. Before coming to William & Mary, she spent eight years as a faculty member at the University of Canterbury in New Zealand. Liz teaches introductory biology for majors and upper-division molecular biology courses. She has mentored graduate students and more than 100 undergraduate research students, many of them coauthoring papers with her on intracellular trafficking of the thyroid hormone receptor in normal and cancer cells. The recipient of numerous awards, including a State Council for Higher Education in Virginia (SCHEV) Outstanding Faculty Award in 2009, Liz received one of the three inaugural Arts & Sciences Faculty Awards for Teaching Excellence in 2011, and a Plumeri Award for Faculty Excellence in 2012. In addition to her work on this text, she is author of *Fundamental Molecular Biology*, now in its second edition, with a third edition underway. Michael Black received his Ph.D. in Microbiology & Immunology from Stanford University School of Medicine as a Howard Hughes Predoctoral Fellow. After graduation, he studied cell biology as a Burroughs Wellcome Postdoctoral Fellow at the MRC Laboratory of Molecular Biology in Cambridge, England. His current research focuses on the use of molecules to identify and track the transmission of microbes in the environment. Michael is a professor of Cell & Molecular Biology at California Polytechnic State University in San Luis Obispo, where he teaches introductory and advanced classes for majors in cell biology and microbiology. In addition to his teaching and research activities, Michael serves as the director of the Undergraduate Biotechnology Lab, where he works alongside undergraduate technicians to integrate research projects and inquiry-based activities into undergraduate classes. Jeff Carmichael received his B.S. in Biology from Slippery Rock University in Pennsylvania and his Ph.D. in Plant Biology from the University of Georgia. As an undergraduate student, he spent some time studying enzyme kinetics through a fellowship at Oak Ridge National Laboratory in Tennessee. His graduate work focused on sexual reproduction in an intriguing group of seed plants. He has been teaching and coordinating Introductory Biology at the University of North Dakota for more than 20 years. He also serves in the Office of Instructional Development where he helps other faculty members incorporate evidence-based best teaching practices in their courses. He has received excellence in teaching awards at UND and as a graduate student in Georgia. His revision of Unit 6 and part of Unit 5 of the Sixth Edition is his first foray into textbook writing. Scott Freeman received a Ph.D. in Zoology from the University of Washington and was subsequently awarded an Alfred P. Sloan Postdoctoral Fellowship in Molecular Evolution at Princeton University. He has done research in evolutionary

biology on topics ranging from nest parasitism to the molecular systematics of the blackbird family and is coauthor, with Jon Herron, of the standard-setting undergraduate text *Evolutionary Analysis*. Scott is the recipient of a Distinguished Teaching Award from the University of Washington and is currently a Senior Lecturer in the UW Department of Biology, where he teaches introductory biology for majors, a writing-intensive course for majors called *The Tree of Life*, and a graduate seminar in college science teaching. Scott's current research focuses on how active learning affects student learning and academic performance. Greg Podgorski received his Ph.D. in Molecular and Cellular Biology from Penn State University and has been a postdoctoral fellow at the Max Plank Institute for Biochemistry and Columbia University. His research interests are in biology education, developmental genetics, and computational biology. Greg's most recent work has been in mathematical modeling of how patterns of different cell types emerge during development and how tumors recruit new blood vessels in cancer. Greg has been teaching at Utah State University for more than 20 years in courses that include introductory biology for majors and for nonmajors, genetics, cell biology, developmental biology, and microbiology, and he has offered courses in nonmajors biology in Beijing and Hong Kong. He's won teaching awards at Utah State University and has been recognized by the National Academies as a Teaching Fellow and a Teaching Mentor. Kim Quillin received her B.A. in Biology at Oberlin College summa cum laude and her Ph.D. in Integrative Biology from the University of California, Berkeley as a National Science Foundation Graduate Fellow. Kim has worked in the trenches with Scott Freeman on every edition of *Biological Science*, starting with the ground-up development of the illustrations in the first edition in 1999 and expanding her role in each edition, always with the focus of helping students to think like biologists. Kim currently teaches introductory biology at Salisbury University, a member of the University System of Maryland, where she is actively involved in the ongoing student-centered reform of the concepts-and-methods course for biology majors. Her current research focuses on the scholarship of teaching and learning with an emphasis on visual model-based reasoning as a science process skill. Emily Taylor earned a B.A. in English at the University of California, Berkeley followed by a Ph.D. in Biological Sciences from Arizona State University, where she conducted research in the field of environmental physiology as a National Science Foundation Graduate Research Fellow. She is currently an associate professor of Biological Sciences at the California Polytechnic State University in San Luis Obispo, California. Her student-centered research program focuses on the endocrine and reproductive physiology of freeranging reptiles, especially rattlesnakes. She teaches numerous undergraduate and graduate courses, including introductory biology, anatomy and physiology, endocrinology, and herpetology, and received the

California Faculty Associationâ™s Distinguished Educator Award in 2010 and Cal Polyâ™s Distinguished Teaching Award in 2012.Â Â

I've only been using this book for 2 weeks and I already enjoy it, which is a big thing to say for a textbook. The last general bio book I had was full of information that drowned out the overall point each section within the chapter was trying to bring. It was full of biochem and technical talk that wasn't needed for this level of class. Freeman's book brings a refreshing approach to writing about biology. Each chapter and section within each chapter, provides the student with the "meat and bones" of what they need to know. It's not hard to comprehend the take home message and to see how each little component adds up to make a larger component. This book has made me love biology again and understand why I returned to school. Good job Scott Freeman!

Biological Science is acclaimed for its clear. The book has a friendly style, excellent illustrations and multimedia material. Connect with real-life biological applications and scientific problems through boxes. In my opinion, Biological Science is the best textbook regarding life and biology.

For the price this book will get you up to speed on all the fairly current thought processes that are now being worked on by the scientific community with regard to modern biological study. I'm using it to take a free- self directed -online biology course offered by MIT. Even though it's a few years old I am blow away at how in depth this text goes compare to Biology 101 I took in college. The book was only 50 cents with prime shipping... How could I go wrong.

I got this text book for my Biology Majors class and I absolutely loved it! Very detailed explanations, great and easy to understand graphs, check your understanding sections helped me to prepare for my actual tests at the school. Also mastering biology website is another amazing source to use while learning this subject. Highly recommend this book to anyone who is taking biology as premed or professional level.

This book works just fine as a substitute for the 5th edition and you can save a lot that way! The only thing you will have to do is renumber the chapters, since there are a few differences there, but content is pretty much the same. I did it and I saved a ton of money!

It's a textbook

Its a dense textbook, like most biology texts, but I found the writing to be for the most part understandable, which is all any collegiate student can ask for. This is a versatile text that applied to several intro-to-intermediate level bio classes for my major and a vast majority of concepts were reinforced with a annotated diagram or a visual labeled image.

This was the required textbook for my Life Sciences 1 course. I thought I would hate it, but ended up reading through it happily. The text itself is not boring, and the way the text is presented and organizes makes it easy to understand the topics. The only questionable thing is the way the Appendix A numbers the answers. I think it really should follow the question numbers instead of starting from 1 each time it transitions to the next section of questions.
